LEARNING MADE EASY

# Machine Learning

for  
**dummies**<sup>®</sup>  
A Wiley Brand

Learn how machine learning algorithms are invaluable

—  
Implement machine learning in Python and R

—  
Use machine learning to accomplish practical tasks

**John Paul Mueller**  
**Luca Massaron**

```
forecastspprint(need_score(Y_validate, predictionsps)) print(confus_matrix(Y_validate, predictionsp, p, p, ps)) print(classification_report(Y_validate, predictions daAccuracy, predictions If you don't get a mistake, stop. He will install and start the Python interpreter (at least). That will help later when we explore the data. We need to compare the models with each other and select the most accurate. 2. # Make p in the dataset template of = model SVC (gamma='auto').fit(X_train, Y_train) predictions = model.predict(X_validation) # Make predictions on em Datasetmodel = SVC (range = 'auto') model.fit (x_train, y_train) predictions = model.predict (x_validation) You can also like to make predictions for database lines. For examples on how to do this, see the tutorial: How to make predictions with Scikit-Learn You can also enjoy saving the template to archive and charge it later to make predictions on new data. # Compare pandas algorithms import pyplotlib import pyplot from sklearn.model_selection import cross_val_score of sklearn.model_selection import stratifiedkfold from sklearn.linear_model import logisticression from sklearn.tree import decisionTreClassifier from Sklelen.
